8:00 AM

Critical Review and Preparation of Manuscripts Reporting Epidemiologic Findings

🕒 8:00 AM - 8:00 AM, Jun 12

Workshop (Virtual) Pre-Co...

WORKSHOP DATE: April 25, 10:00am - 2:00pm Mountain Time

Overview abstract: In this half-day workshop, participants will critically review a paper as initially submitted to the American Journal of Epidemiology (AJE), but not yet published. The paper will be sent to participants in advance of the workshop for their critical review. During the workshop, a presentation will be made on some of the main points to be considered when preparing or reviewing a manuscript. Small group work will follow the presentation so that participants can compare their reviews, prepare a consolidated list of critical comments on the paper and a decision letter. Each group will designate a rapporteur, who will present the group's review of the paper and decision letter to the whole group of participants. At the end of the workshop, students will receive copies of the manuscript's AJE reviews, the initial editorial decision and the final version of the paper.

Developing Competencies for Doctoral Students in Epidemiology

🕒 8:00 AM - 8:00 AM, Jun 12

Workshop (Virtual) Pre-Co...

WORKSHOP DATE: March 1, 10:00am - 12:00pm Mountain Time

The overall objective of this two-part workshop is to develop a set of specific competencies for doctoral students in epidemiology. We use competencies in this context to refer to a set of topics that doctoral students in epidemiology programs should demonstrate some mastery of prior to completing their training. The Council on Education in Public Health (CEPH) has formal competencies for graduate programs in public health, but their criteria are very broad and not specific to graduate programs in epidemiology. Moreover, CEPH accredits DrPH programs, not PhD or ScD programs in epidemiology. Recently, Alison Abraham and colleagues developed a set of basic competencies for epidemiologists. However, it is difficult to translate their competencies (e.g. “Competency to collect valid and relevant high-quality data”) into specific topics to include in doctoral training programs in epidemiology, which limits their utility for faculty members tasked with teaching students.

Through this workshop, we aim to develop expert consensus around topics that PhD students in epidemiology “must know” before graduating. The end-goal of this workshop is to create a written document to be submitted for publication and dissemination to standardize best practices in epidemiology education. This fits in with the broader theme of institutional equity and diversity that is emphasized by SER: students at all institutions should all be able to access high quality training in epidemiology. Creating a consensus document of specific competencies is a step towards ensuring quality doctoral education for all students in epidemiology.

This workshop will take place in two parts. The first part will be conducted virtually as a pre-conference workshop for the SER mid-year meeting. At this workshop, Hailey Banack and Katie Lesko will facilitate an open forum discussion to create a master-list of specific topics for doctoral students in epidemiology. The second part of the workshop will be conducted in person as a pre-conference workshop for SER 2023 in Portland, Oregon. This workshop will be focused on discussing, synthesizing, and revising the initial set of competencies from the mid-year meeting. The second workshop will be structured as a round-table discussion to maximize participation and facilitated by Drs. Lesko and Banack as well as a senior faculty member, Dr. Laura Rosella, PhD Program Director, University of Toronto. Written materials from the first workshop will be circulated for review in advance of the in-person meeting in Portland. The three workshop facilitators will also lead breakout groups focused on building consensus and ranking the priority of topics to be included in the competencies. In between the two workshops, we will create a web-based survey informed by data gathered at our first meeting, to collect information on this topic broadly from SER members. The results of this survey will be shared at the second (in-person) meeting for discussion.

To ensure the workshops are productive and participants have the requisite skills to contribute to the development of competencies, we will ask interested individuals to fill out a very brief application. The application will include only 1-2 questions, asking participants to describe their background and how they will contribute to the workshop. An important goal for this workshop is to include a diverse group of participants to get different perspectives on ‘required topics’ for epidemiology students. This workshop is aimed primarily for faculty with expertise teaching doctoral students but will also include student representatives. We will aim to recruit specific senior faculty members with interest in doctoral training to contribute to the workshop, some of whom participated in the SER 2022 workshop on teaching advanced epidemiologic methods (e.g., Tim Lash, Chanelle Howe, Rich MacLehose). We hope to include individuals from a variety of different epidemiology programs in the US, Canada, and internationally; from big schools of public health and small departments of epidemiology; different eras of epidemiology training; racial and ethnic diversity; individuals from differing sex/gender perspectives; and varying areas of substantive expertise within epidemiology.

Introduction to parametric & semi-parametric estimators for causal inference

🕒 8:00 AM - 8:00 AM, Jun 12

Workshop (Virtual) Pre-Co...

WORKSHOP DATE: April 21, 10:00am - 2:00pm Mountain Time

This workshop will introduce participants to the Causal Roadmap for epidemiologic questions:

- 1) clear statement of the research question
- 2) definition of the causal model and parameter of interest
- 3) assessment of identifiability that is, linking the causal effect to a parameter estimable from the observed data distribution
- 4) choice and implementation of estimators including parametric and semiparametric approaches
- 5) interpretation of findings. The focus will be on estimation with a simple substitution estimator (parametric G-computation), inverse probability of treatment weighting (IPTW), and targeted maximum likelihood estimation (TMLE) with Super Learner. Participants will work through the Roadmap using an applied example and implement these estimators in R during the workshop session.

R for Epidemiologists

🕒 8:00 AM - 8:00 AM, Jun 12

Workshop (Virtual) Pre-Co...

WORKSHOP DATE: May 16, 10:00am - 2:00pm Mountain Time

This workshop will introduce participants to the R statistical computing platform for use in epidemiologic analysis. It is not intended to transform untested novices into R wizards in a mere half-day; rather, the goal will be to introduce the conceptual underpinnings, tools, and external resources that participants will need to overcome barriers to using R that they might encounter on their own, later. The material is designed for epidemiologists who are already familiar performing analyses using other statistical software (e.g. SAS/Stata/SPSS) but who have no first-hand experience with the R language. More specifically, the course will cover 1) basic R syntax, 2) importing data, 3) constructing, cleaning, and manipulating data objects, 4) loading and using external packages, 5) simple statistical modeling, and 6) graphics. Participants must bring a laptop with R installed; the instructor will be available by email beforehand to assist with R installation if difficulties arise.

High-dimensional propensity score and its machine learning extensions in residual confounding control in pharmacoepidemiologic studies

🕒 8:00 AM - 8:00 AM, Jun 12

Workshop (Virtual) Pre-Co...

WORKSHOP DATE: May 4, 10:00am - 4:00pm Eastern Standard Time

The use of retrospective health care claims datasets is frequently criticized for lacking complete information on potential confounders. Ultimately, the treatment effects estimated utilizing such data sources may be subject to residual confounding. Digital electronic administrative records routinely collect a large volume of health-related information; and many of whom are usually not considered in conventional pharmacoepidemiological studies. In 2009, a high-dimensional propensity score (hdPS) algorithm was proposed that utilizes such information as surrogates or proxies for mismeasured and unobserved confounders in an effort to reduce residual confounding bias. Since then, many machine learning and semi-parametric extensions of this algorithm have been proposed to exploit the wealth of high-dimensional proxy information properly.

This workshop will (i) familiarize participants with the difference between propensity score vs. hdPS, (ii) demonstrate logic, steps and implementation guidelines of hdPS utilizing an open data source as an example (using reproducible R codes), (iii) explain the rationale for using the machine learning extensions of hdPS, and their statistical properties, and (iv) discuss advantages, controversies, and hdPS reporting guidelines while writing a manuscript. Attendees should have prerequisite knowledge of multiple regression analysis and working knowledge in R (e.g., basic data manipulation and regression fitting).

8:30 AM

Mentor Training for Epidemiologists

🕒 8:30 AM - 12:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Although mentoring relationships are critical for academic and career success, mentors are often left to learn how to carry out their part in these relationships through trial and error. And yet, there is a growing movement to prepare mentors more deliberately. The National Academies of Science, Engineering and Medicine released a report in 2019 titled 'The Science of Effective Mentorship in STEMM.' This report documents the wealth of research on factors that contribute to effective mentorship, and ways that mentors can build these skills. The Center for the Improvement of Mentoring Experiences in Research (CIMER) has developed and tested curricula that use this evidence-based approach to promote effective mentorship. In this workshop, CIMER-certified facilitators will use familiar scenarios, activities, and small-group discussions to allow participants to reflect on their own mentoring experiences and work through mentoring challenges. Workshop content will include a brief summary of the science of mentorship and focus on key mentoring competencies, including maintaining effective communication, aligning expectations, assessing understanding, and addressing equity and inclusion. Participants will refine their individual mentoring styles and leave with concrete plans, tools, and resources. NOTE: The workshop is aimed at individuals with at least some experience as a mentor including early-, mid-, and late-career faculty as well as advanced postdoctoral fellows.

Causal inference for time-varying exposures

🕒 8:30 AM - 12:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

This workshop applies the Causal Roadmap to estimate the causal effects with time-vary exposures, such as the cumulative effect of an exposure over time and the effects on survival-type outcomes with right-censoring. We will cover longitudinal causal models, identification in the presence of time-dependent confounding, and estimation of joint treatment effects using G-computation, inverse probability weighting (IPW), and targeted maximum likelihood estimation (TMLE) with Super Learner. During the workshop session, participants will work through the Roadmap using an applied example and implement these estimators with the ltmle R package. Prior training in causal inference with a single time-point exposure is recommended.

Causal Mediation Analysis

8:30 AM - 12:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Causal mediation analysis can provide a mechanistic understanding of how an exposure impacts an outcome, a central goal in epidemiology and health and social sciences. However, rapid methodologic developments coupled with few formal courses presents challenges to implementation. Beginning with an overview of classical direct and indirect effects, this workshop will present recent advances that overcome limitations of previous methods, allowing for: (i) continuous exposures, (ii) multiple, non-independent mediators, and (iii) effects identifiable in the presence of intermediate confounders affected by exposure. Emphasis will be placed on flexible, stochastic and interventional direct and indirect effects, highlighting how these may be applied to answer substantive epidemiological questions from real-world studies. Multiply robust, nonparametric estimators of these causal effects, and free and open source R packages (medshift and medoutcon) for their application, will be introduced.

To ensure translation to real-world data analysis, this workshop will incorporate hands-on R programming exercises to allow participants practice in implementing the statistical tools presented. It is recommended that participants have working knowledge of the basic notions of causal inference, including counterfactuals and identification (linking the causal effect to a parameter estimable from the observed data distribution). Familiarity with the R programming language is also recommended.

Epidemiological analysis of electronic health records

8:30 AM - 12:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Increasingly data mined from the electronic health record (EHR) are being used for secondary analysis in epidemiological research. But more data does not equate to better quality research. In this workshop, we will cover the fundamentals of working with EHR data and designing and conducting valid epidemiological analyses. The workshop will be half didactic lecture and half interactive group exercises. Participants will provide planned or active EHR-based research questions in advance, which form the basis of the group exercises. Each small group will identify challenges and opportunities answering the research questions with data from the EHR. Following the breakout groups, all participants will reconvene to discuss the strengths and weaknesses of the research, with specific recommendations offered to ensure success.

Speakers

Neal Goldstein
Drexel University

Milena Gianfrancesco
Pfizer, Inc.; UCSF

Interaction Analysis

🕒 8:30 AM - 12:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

This workshop will provide a broad introduction to the topic of interaction. We will discuss interaction on additive and multiplicative scales, and their relation to statistical models (e.g. linear, log-linear and logistic models). We will describe procedures for interaction when logistic models are fit to data but when additive and not just multiplicative measures of interaction are desired, and how the two can be simultaneously mapped onto an interaction continuum. We discuss issues of confounding for interaction analyses and how whether control has been made for only one or both of two exposures affects interpretation. We further discuss conditions under which interaction gives evidence of synergism within the sufficient cause framework, when interaction is robust to unmeasured confounding, methods attributing effects to interaction, selecting optimal subgroups for treatment, and power and sample size calculations for interaction. Illustrations will be given from environmental, genetic, and infectious disease epidemiology. Software code will be provided.

1:00 PM

A Primer on Quantile Regression for Epidemiologists

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

Quantile regression is a powerful method of evaluating how an exposure affects the entire outcome distribution; this is distinct from analyses on how exposures impact the means, which are more common in the epidemiological literature. However, quantile regression remains underused in epidemiology. Our proposed workshop has two aims: 1) introduce participants to quantile regression with a focus on distinguishing between estimators targeted at the conditional versus marginal outcome distribution; and 2) equip participants to conduct quantile regression analyses in statistical packages such as R or Stata. Our workshop will have three phases. Phase 1 will be theoretically oriented and will provide participants with knowledge of quantile regression theory. Phase 2 will be empirically oriented and will provide participants with hands-on experience of fitting quantile regressions to a dataset we will provide. Phase 3 will sketch extensions to quantile regressions, such as quantile regression estimators for longitudinal data. Phases 1 and 2 will form the bulk of the workshop. All sessions will be interactive to encourage hands-on experience and learning. Our workshop is targeted at beginners, i.e., individuals with no prior experience of using quantile regressions. However, we do presume that participants have a working knowledge of linear regressions since we will use mean models (ordinary least squares regression) as the starting point to develop ideas about quantile regressions.

Causal inference and competing events

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

A competing risk event is any event that ensures the outcome of interest cannot subsequently occur. For example, in a study where prostate cancer death is the primary outcome, a fatal stroke is a competing event because an individual cannot die of cancer once they have died of stroke. When competing events are present, many possible definitions of a causal effect may be considered. Choosing a causal effect of practical interest requires understanding the interpretation of different counterfactual contrasts and the assumptions needed to identify them using the study data and subject matter knowledge. This workshop will introduce participants to a counterfactual framework for causal inference in the face of competing events. Participants will learn how to articulate and interpret different types of causal effects when competing events are present, and approaches to estimating them under transparent assumptions with the aid of causal diagrams. In part I, we cover counterfactual contrasts of popular parameters from the competing risks literature, including contrasts of cause-specific and subdistribution hazards, and cause-specific cumulative incidences and their relation to total and controlled direct effects from the mediation literature. In part II, we introduce the separable effects, new causal effect definitions that may be of particular clinical relevance in competing events settings. Theoretical concepts will be illustrated via practical examples and R code provided.

Intro to Spatial Analysis & GIS for Spatial Epidemiology in R

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

Measurements of neighborhood social determinants of health are increasingly urgent in modern public health thinking, and are thought to drive and/or reinforce racial, social, and spatial inequities. Sometimes this necessitates an investigation of neighborhood health patterns, like premature mortality at the census tract scale. Sometimes we're interested in area factors like poverty, access to affordable housing, distance to the nearest health provider, or polluting factories -- and how these factors magnify, moderate, or mediate individual level health. Spatial analysis is an important tool in uncovering the ways in which where people live, work, and play can influence health outcomes. This workshop will present an introduction to spatial analysis, mapping, and GIScience for health applications & spatial epidemiology using the open source R environment. During this interactive workshop, participants will be introduced to basic concepts in spatial data analysis, generate thematic maps visualizing neighborhood-level health phenomena, geocode and integrate community resource locations (such as health providers, schools, or sources of pollution) for further exploration, and calculate new spatial access variables. We will review how research questions and hypotheses are updated at each stage of exploratory spatial data analysis. Participants should have a basic understanding of the R environment but no experience is necessary with spatial data or R-spatial libraries.

Media Training: Skills for Communicating Research Findings

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

The skills needed to effectively communicating research findings require training and practice. This workshop will help epidemiologists improve their ability to effectively communicate their research findings to the media, and through them to the public and specific audiences, such as clinicians, public health practitioners, and other researchers. While this workshop will focus on basic skills of communicating to the media, the skills can also be applied when disseminating information to community partners and other audiences. In addition to a didactic portion, there will be ample opportunity to practice message development and engage in mock interviews. We will break into groups in order to facilitate deeper learning from each other.

Reproducible Epidemiology in R

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

Have you ever painstakingly copied and pasted output into individual table cells, only to find yourself starting from scratch when you receive an updated dataset from your collaborators? Have you sat twiddling your thumbs while rerunning all of your analyses just because you added a single covariate to a regression model? In this workshop, we will learn techniques for avoiding these frustrating, slow, and error-prone processes. We will focus on conducting reproducible analyses using the 'targets' package in R and on creating reproducible documents using RMarkdown and/or Quarto. We will develop a workflow that involves cleaning data, fitting models, creating figures and tables, and extracting statistics to report in a manuscript. We'll then see how we can fiddle with various steps of the workflow while maintaining reproducibility. Participants should have previously used R for analysis, but do not need to be experts.

The ABC's of M-estimation

🕒 1:00 PM - 5:00 PM, Jun 13

Workshop (Onsite) Pre-Co...

M-estimation is a generalization of maximum likelihood that allows a set of estimating equations to be stacked together and can be used for a variety of epidemiologic measures. Importantly, M-estimators offer a simple way to estimate the variance for complicated measures. The sandwich variance estimator allows the uncertainty of parameters in one estimating equation to propagate into the uncertainty of another estimating equation. Therefore, more computationally demanding procedures, like bootstrapping or Monte Carlo, can be avoided. This feature is particularly important for many common estimators in causal inference (e.g., inverse probability weighting) which involve the estimation of so-called 'nuisance' parameters (e.g., propensity scores). Finally, M-estimators can be implemented programmatically, avoiding tedious derivative calculations or matrix algebra. Despite advantages, uptake of M-estimation has been limited in the epidemiology community. To address this deficit, we propose a pre-conference workshop introducing the basics of M-estimation and applying M-estimators in a series of examples (e.g., regression, inverse probability weighting, data fusion, etc.). Workshop attendees will gain an understanding of M-estimation, and experience in applying M-estimators in common epidemiologic problems. Support for SAS, R, and Python will be provided for the workshop.

An introduction to directed acyclic graphs: What you never wanted but needed to know about bias and didn't even know to ask.

🕒 5:30 PM - 7:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

This workshop will introduce participants to directed acyclic graphs (DAGs). We will review the basic principles and show how they can be used to determine appropriate sets of variables for estimating total causal effects of exposure (treatment). Participants will work through concrete examples of increasing complexity. We will also introduce how DAGs can be used in more advanced applications, including natural and controlled direct and indirect effects and study design.

Eye-Tracking Data Analysis for Epidemiological Context

🕒 5:30 PM - 7:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Eye-tracking data have grown in popularity in behavioral studies but have recently gained traction in other fields, such as neuroscience and education. While their use in epidemiological studies is underexplored, they are value-adding components for various epidemiological models. This workshop will cover the basics of designing eye-tracking studies, collecting, and analyzing eye-tracking data within epidemiological contexts. The workshop will include a didactic lecture and an interactive practice activity. Participants will be provided with short reading materials before the class to introduce them to eye-tracking measures. They will identify research questions that can be answered using eye-tracking data.

How to make a picture worth a thousand words: Effectively communicating your research results using statistical graphics

🕒 5:30 PM - 7:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Epidemiologists can use statistical graphics to understand our data and to guide us toward correct inferences. Well-designed graphics can also be powerful tools for communicating our study findings. However, while statistical software makes it easy to produce certain types of figures, the default options leave much to be desired. Too often, the result is figures that distract, confuse, or even distort data. In this workshop, participants will first learn the fundamentals of effective data visualization. This includes selecting appropriate chart types, drawing attention to the relevant data, using effective visual cues, and providing helpful context. We will discuss how to put these principles into practice, leading viewers to make comparisons, identify trends, and find meaningful correlations. Finally, we will walk through techniques for going beyond the default settings of various software packages to produce well-designed figures.

Positionality for Epidemiologists: Exploring the Role of Our Social Identities in Quantitative Research

🕒 5:30 PM - 7:30 PM, Jun 13

Workshop (Onsite) Pre-Co...

Who we are, who we are in community with, and where we are from all play a role in the science we do- from the research questions we ask to the evidence we use to back our claims. Positionality refers to how our social identities and lived experiences not only influence the choices we make throughout the research process but also how those factors shape how others view us, our work, and the power we hold in a specific research context. The ways in which our perception of self/others, experiences inside/outside of the academy, and power dynamically interact has a direct impact on us as epidemiologists and the research we conduct. To address the bias that we as researchers may be unknowingly introducing into our science, there is a need to develop a practice of critical self-reflection in our field. This workshop aims to build an understanding of the role of positionality in epidemiological research, examine how our social identities influence our work, and support participants through the development of their own positionality statements.

Successful models for data sharing and ensuring productive collaborations with state and local health departments: Lessons from peer navigator overdose prevention interventions

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Columbia

Symposia

Observational studies and randomized trials can benefit greatly from the use of routinely collected data by state and local government agencies. For example, linkage to and analysis of administrative data can improve exposure and outcome assessment, minimize missing data, and mitigate selection biases involving loss to follow-up. However, there are numerous structural, logistical, legal, and philosophical barriers that can adversely impact productive data sharing relationships between academic researchers and governmental agencies. In this symposium, we will hear from four researchers who have established highly productive collaborations with a variety of state agency partners. Using (1) emergency department-based peer navigator overdose prevention interventions and (2) 911 dispatch and pre-hospital emergency medical care as case studies, they will provide audience members with critical insights into developing and sustaining data sharing relationships, and explore the implications thereof. They will discuss barriers to accessing, linking, and analyzing administrative data and share approaches for overcoming these challenges. This tutorial-style symposium will be of particular value to early- and mid-career researchers who are interested in building collaborative relationships with state and local health departments to conduct cutting-edge epidemiologic research.

Can you teach an old dog new tricks? Modern perspectives on the case control study

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Salon G-H

Symposia

In 1992, Wacholder and colleagues published three papers in the American Journal of Epidemiology describing the principles for the selection of control for case control studies. These papers were published over thirty years ago but they are still an important resource for teaching epidemiology students and are considered foundational for our understanding of case control studies. Since the 1990s, however, much has changed in the availability, size, and diversity of data sources for case control studies. There have also been tremendous advances in computing power and resource sharing, facilitating novel case-control studies that address prior limitations of case-control studies. The objective of this symposium is to highlight modern applications of the case control study design and showcase methodologic advancements in case control studies. The case control study is also frequently maligned in epidemiologic teaching as a “less valid” study design. Epidemiologists often view case control studies as inferior, or inherently more biased, than randomized trials or cohort studies. In this symposium, we will also feature a point-counterpoint debate on the merits of case control studies. Team Platt (led by Rob Platt, McGill University) will face off against Team Fox (led by Matt Fox, Boston University) in a lively and engaging debate, featuring audience participation, on the merits of using case control studies in a modern context.

A 25 Year Retrospective on Multilevel Social Epidemiology

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Salon E

Symposia

In the late 1990s, multilevel modeling burst into epidemiology journals with bold promises about distinguishing contextual from compositional effects, and solving hierarchical inference problems with random effects. Rather than treating hierarchical structure as a mere statistical nuisance, as GEE models do, social epidemiologists insisted that random effects would solve ecological and cross-level inference problems, and that structural inequalities could be revealed in the heterogeneity of effects over contexts. Neighborhood studies became a ubiquitous feature of the literature, and many leading social epidemiologists including Diez Roux, Subramanian and Kawachi become prolific exponents of this exciting statistical methodology. But now a quarter of a century later, what has become of this whole movement? What is the place of multilevel models in our field now? This symposium presents a retrospective across a quarter century of this work, including the neglected “hybrid” model, the general displacement of random effects with fixed effects (especially TWFE models in differences-in-differences analyses), and highlighting the current promise of multilevel models today as the leading methodology for operationalizing intersectionality. Speakers span the range from an original pioneer of the methodology to the next generation of innovators who have adapted the models for our times.

Does Machine Learning Work?: Designing Better Simulation Studies for Inference

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Mt Hood

Symposia

Machine learning (ML) methods are an increasingly important tool for epidemiologists. Before relying on any algorithm, a scientist must first establish whether it works. This requires first articulating what it means for a method to “work.” In settings where ML is used to adjust for validity threats (e.g., confounding), ideal properties include statistical consistency, low bias, low mean squared error, and nominal confidence interval coverage.

Outside of theoretical evaluations, simulation studies are commonly deployed to evaluate if a method works. Simulations provide an opportunity to experimentally evaluate how a method will perform under well-defined conditions. Despite ML methods’ abilities to flexibly model complex data sets, simulation studies are routinely constructed using simple parametric data generating mechanisms. Even if an ML method is found to perform well in these settings, whether it will perform well in scenarios not governed by simple parametric data generating mechanisms will remain unknown.

Recently, Generative Adversarial Networks (GAN) and Credence approaches have been proposed as alternatives to simple parametric data generating mechanisms. These approaches focus on generating simulated data that more closely approximates real data encountered in epidemiology. This symposium will focus on the problem of designing of simulation studies to evaluate ML methods via an introduction to and discussion of the GAN and Credence approaches to simulation design

Measuring Sex, Gender, and Sexual Orientation in Epidemiologic Research

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Salon I

Symposia

Sexual orientation, gender identity, and sex characteristics (SOGISC) are key determinants of health for everyone, not just sexual and gender minority populations. Historically, epidemiologists have rarely collected SOGISC data and, when it has been collected, it has been poorly measured. This measurement is necessary in every epidemiological study to avoid misclassification, identify health disparities, and, more broadly, promote equity and inclusion. Respectful and accurate SOGISC measurement can be difficult due to differences in conceptualization and terminology for these constructs across age cohorts, regions, racial and ethnic groups, and languages; measurement can also be further complicated when it is among sexual and gender minority compared to majority individuals. Contextual factors (e.g., stigma, mistrust) add to this complexity, as do the many methodological issues of identifying changes over time and proxy reporting. In 2022, the National Academies of Science, Engineering, and Medicine (NASEM) released a landmark report that reviewed existing approaches to SOGISC measurement and recommended a set of measures for use by NIH and in other large-scale population surveys. In this symposium, speakers will present and critique the NASEM recommendations, present alternative approaches for various research settings, and identify promising practices for epidemiologists to optimize SOGISC measurement towards advancing health equity.

Emerging Approaches to Investigating Climate Health Disparities

🕒 10:15 AM - 11:45 AM, Jun 14

📍 Meadowlark-Douglas

Symposia

As the climate crisis worsens, populations across the world are at higher risk of exposure to extreme heat, disasters, and air and water pollution. These risks are not evenly distributed, as in many cases the people who are least responsible for the climate crisis end up bearing the brunt of its impacts. Population health researchers must generate studies to help us understand how to protect the health of the most vulnerable and to mitigate or eliminate health disparities in a changing climate across diverse geographies and populations. Through this symposium, a partnership between SER and the International Society for Environmental Epidemiology (ISEE), we will bring together researchers from diverse career stages who are using novel approaches to investigate climate change and health disparities. The session will foster interdisciplinary discussion and highlight environmental and climate justice issues. Panelists include epidemiologists working at the intersections of structural racism and wildfires, extreme heat, and the energy transition, as well as an ecologist with expertise in Indigenous wildfire science. Such multidisciplinary collaborations can aid our understanding of how complex and changing social and environmental systems impact health and what we can do to eliminate health disparities.

Chair(s): Joan A. Casey and Tamarra James-Todd

Presenters:

- Carina Gronlund- Preventing "weathering": increasing housing weatherization and indoor thermal comfort in the U.S. to reduce disparities in climate impacts
- Daniel Carrion- Heat and the home environment: (in)equity in the energy transition
- Misbath Daouda- Energy transitions: who benefits and how do we know?
- David J.X. Gonzalez- Wildfire smoke and maternal health disparities in California
- Lara Schwarz- Socio-geographical variation in the effects of extreme heat on mortality: a spatial analysis of municipality-level vulnerability across Mexico

Emerging Perspectives on Selection Bias

🕒 10:45 AM - 11:45 AM, Jun 14

📍 Salon B-D

Symposia

Selection bias is a fundamental concept in epidemiologic methods, and it is one of the most important threats to the validity of applied epidemiologic research. However, it remains stubbornly mysterious. This session will present emerging methodological and applied points of view on selection bias. Theoretical perspectives will include its definition in terms of potential outcomes, its representation with causal graphs, its relationship to missing data, its occurrence in longitudinal data, its relationship to generalizability and transportability, and the role played by effect modification. Applications will include coronary artery surgery and measurement of health disparities as well as teaching and communication about selection bias. This session will have four speakers with approximately 20 minutes each to present (15 minute presentation with 5 minutes for discussion split between the end of the talk and the end of the session) and a chair who will also serve as a discussant.

Chair(s): Issa Dahabreh

Presenters:

- Haidong Lu- Epidemiologic Rethinking on Selection Bias
- Chanelle Howe- Quantifying a Health Disparity: Considerations Concerning Selection Bias
- Sarah E. Robertson- Examining Heterogeneity when Extending Causal Inferences to a New Population
- Eben Kenah- A Potential Outcomes Approach to Selection Bias

Brain-"storming" approaches to studying climate change and health

🕒 12:15 PM - 1:15 PM, Jun 14

📍 Salon E

Lunchtime

Climate change is the greatest threat to human health of our time. Climate change alters the frequency and behavior of extreme weather events making it harder for communities to prepare and respond to increasingly unpredictable circumstances. Climate-change-fueled weather events can disrupt access to care and exacerbate environmental hazards, with devastating effects on individuals, communities, and society.

Epidemiologists are increasingly designing studies to understand and address the effects of climate change on health. Yet, as a relatively new subfield of epidemiology, there are several distinct and complex research challenges to consider. In this session, we propose to have a conversation with epidemiologists who are currently engaged in, interested in, or have questions about studying the health impacts of climate change.

- Leticia Nogueira - Overview of the current state of climate change and health research
- Jennifer Lund - Who and what should I study: Involving community in research prioritization
- Tarik Benmarhnia - Where are the data needed to study climate change and health?
- Alexandra White - When do we measure climate-related exposures and outcomes?
- Gila Neta - How do we get climate change and health research funded and our findings implemented?
- Jessica Chubak - Moderator

Career Pathways for Master's-Level Students and Professionals: Academia, Government, Consulting, Healthcare, & Healthcare Technology

🕒 12:15 PM - 1:15 PM, Jun 14

📍 Salon B-D

Lunchtime

SER has a genuine commitment towards supporting and promoting their master's-level professional membership. Sponsored by the SER Membership & Nominations Committee, 2023 will be the fifth year we offer the master's-level symposia as we continue to promote and expand membership of this growing group of scientists.

This session highlights career pathways of master's-level SER members in the areas of academia, government, consulting, healthcare, and healthcare technology. We have recruited panelists from the public and private sector (University of Virginia; University of Massachusetts Medical School-Baystate; California Department of Public Health; Cardno ChemRisk, now Stantec; St. Francis Hospital & Heart Center; and DLH Corporation) to provide a wide variety of perspectives to attendees. Panelists will provide brief overviews of their careers as master's-level epidemiologists; and attendees will have the opportunity to ask questions and engage in discussion.

The overall objective of the proposed Master's-Level Symposia sessions is to highlight the valuable contribution of master's-level students and professionals in epidemiologic research, foster their professional growth inside and outside of SER, and demonstrate SER's devotion to this esteemed portion of the membership.

Beyond research and the academy - using epidemiology for social change

🕒 12:15 PM - 1:15 PM, Jun 14

📍 Salon F

Lunchtime

You are an epidemiologist who wants to better advocate for evidence-based policy in your community. How do you best use your skills and voice to influence decision-makers? We spend years learning how to use our technical expertise to answer public health questions. How do we as members of our local communities best influence decision-makers? How do your general epi skills make you one of the most qualified to discuss evidence and advocate for better and more equitable health in your own community? You don't have to be an early childhood education researcher to have something to offer at your local school board meeting. You don't have to be the expert in addiction research to be able to discuss harm reduction strategies with county commissioners. In this session, we'll show you how to use your general epi/public health knowledge to effectively advocate for positive social change in your community, whether or not you are a subject matter expert in the topic. Our four speakers work in a variety of subject areas and interface with policy makers at varying levels of government and social action. They'll share lessons they've learned in how to effectively communicate scientific evidence with local stakeholders and decision makers. Come learn how you can start making a difference with the skills you already have.

- David Gonzalez- Environmental epidemiology and the press

Meeting the moment: Developing a toolbox for policy translation using epidemiologic research

🕒 12:15 PM - 1:15 PM, Jun 14

📍 Salon I

Lunchtime

As the COVID-19 pandemic and associated economic and mental health crises have made clear, epidemiologic research plays an important role in informing the development and implementation of public policy. However, epidemiologic training programs rarely include guidance or instruction in policy translation; moreover, methods for effectively communicating epidemiologic work to policymakers and other key stakeholders are rapidly changing in the age of big data, open science, social media, and mis/disinformation. To bridge these gaps, this lunchtime session will feature a panel of speakers from diverse epidemiologic and public health sub-specialities with extensive expertise across the policy translation spectrum. In a series of flash talks, panelists will discuss the overall process of policy translation, how to make epidemiologic research more policy-relevant (e.g., strategic science), important tools for synthesizing and disseminating epidemiologic research to policymakers (e.g., policy briefs), and the role of interdisciplinarity and team science in this work. Panelists will also describe how strategies for translating epidemiologic evidence differ by audience (e.g., policymakers and staff vs. community advocates) and detail their own struggles and successes in policy translation. Across all talks, an emphasis will be placed on how the intersections between epidemiology and public policy can – and should – be leveraged to improve population health and advance health equity.

- Amanda Raffoul– Building your epidemiologist-advocate toolbox: Lessons learned from state-level legislative advocacy
- S. Bryn Austin– Using strategic epidemiology to inform eating disorder prevention and policy efforts
- Brittany Charlton– Sex education, abortion, and LGBTQ rights

Who wants to be an Epidemiologist? – 5th edition

🕒 12:15 PM - 1:15 PM, Jun 14

📍 Mt Hood

Lunchtime

The four previous editions were all very well attended. The target audience is beginner to intermediate and the session will roughly follow the format of Who Wants to be a Millionaire game show. Contestants are chosen from the audience. Each question has four possible answers. Contestants choosing the correct answer continue to play. Each contestant has three “lifelines” (ask the audience, ask a friend, 50-50 choice). If they make a mistake, they are replaced with another audience member.

One of the 3 judges will explain the correct and incorrect answers. To increase edutainment, we include controversial questions with more than one correct answer, but only one “official” best answer. Contestants can challenge questions but if there is only one answer (i.e. an inappropriate challenge), the contestant is replaced with another audience member. To maximize participation, audience members may challenge a contestant’s answer. If correct, the audience member becomes the new contestant, or gets to choose which other audience member will become the new contestant. Other surprises await.

Speed Networking

🕒 7:00 AM - 7:45 AM, Jun 15

Breakfast

Student and Postdoc

Students and post-docs have the opportunity to meet and network with epidemiologists (mentors) in small groups, following a “speed dating” format. Each mentor will be paired with 2-3 trainee attendees at a time, and trainees will rotate around the room during the session. This fast and fun event is a great way to practice introductions and have brief discussions around career and professional development. We hope to see you there.

Pre-Registration Required.

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Salon I

Lunchtime

The Society for Epidemiologic Research (SER) has increased largely their outreach to Latin America, including Brazil, the non-English-Speaking Caribbean. Increasing the diversity engagement of researchers who Spanish and Portuguese at SER will positively impact the field of epidemiology. Although researchers attending SER from Latin America are still small

numbers, the impact and the quality of research broadcasted at SER makes it an interesting venue for established and emerging scholars. Some of the challenges, and in some cases the reluctance for the attendance is the language barrier. We believe that given the commitment that SER has on diversity, additional engagement of already SER members could translate in stronger international networks and development of novel research in Latin America, which could help improve the health of populations throughout the continent. This symposium will bring together five researchers (in different stage careers, diverse gender, and ethnicity backgrounds) conducting epidemiologic research in the region. We will share current challenges (e.g., accessing and securing funding, knowledge translation and uptake of new methodological approaches), opportunities (e.g., collaborations North-South and South-South), and future goals to improve research in the region (e.g., academic training and ideas to prevent using the region as a “data provider lab only”).

It's personal: navigating research questions that stem from our lived experiences

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Salon G-H

Lunchtime

The purpose of this symposium is to learn from epidemiologists or other health professionals who have investigated research questions that affect them personally or stem from lived experiences. How do we navigate professionally investigating a problem that has affected our own health or the health of a loved one? What compels us and what obstacles do we face when conducting such work? The purpose of this symposium is to bring together researchers who have experienced or are planning to study very personal research questions. All population-based research is personal to some extent as it may affect the people in our community. This is particularly evident in the COVID-19 pandemic. Yet what distinguishes this panel is that the health problems we encounter are less common, understudied, and have left us feeling compelled to seek answers. In this symposium we will share our stories and create a forum where we can learn from one another on how to navigate the realities of conducting personal research, including hardships and negative emotions such as isolation and self-doubt, but also the many positive aspects of intimate research, such as our study findings being directly relevant to our own lives or that of loved ones.

Words have meaning

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Mt Hood

Lunchtime

This 2nd version of Words have Meaning is an edutainment lunchtime session with two skits that highlight difficulties when epidemiologists or biostatisticians collaborate with clinicians. The focus of the skits is to highlight common communication challenges between clinicians and methodologists when discussing research questions and analytical strategies. An emcee will briefly introduce each skit. The actors then play out the skit, with PowerPoint “thought bubbles” displaying the actors (in)congruent thoughts with their words spoken on a screen. From the clinician perspective, the two topics are: “How can I intervene to improve adherence to my treatment program and then study how this intervention affects important outcomes?” This skit addresses how methodologists communicate advantages and disadvantages of particular analytical strategies. The topic of the second skit is “How can we use the results of a study to change the intervention so it requires less resources without jeopardizing effectiveness?” This skit addresses related to mediation such as controlled effects, natural/pure effects and separable effects. Although we focus on how to better communicate, we will be explaining the methodological issues (e.g. complier average causal effect versus population average causal effect, controlled effects versus separable effects) because they are fundamental to understanding how to communicate the relevant information.

Epidemiology in Japan: Lessons from Super-Aging Society Preparing for the Future

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Salon E

Lunchtime

Japan is a super-aging society with the highest life expectancy in the world, where nearly 30% of the population is 65 or older. Aging is an inevitable facet of life, increasing the risk of several diseases including metabolic disorders, cardiovascular diseases, dementia, and cancer. In addition to aging, the Japanese population has experienced substantial health damage from a multitude of natural disasters, including the 2011 Great East Japan Earthquake and tsunami.

In this session, Japanese speakers with professional backgrounds from several institutions will present major public health challenges stemming from population aging and large-scale disasters and share the current state of knowledge on these topics. Through the discussion about how to cope with those challenges, we will provide the clue for future epidemiological research in Japan and other countries facing similar problems. During the session, we will also cover the perspective of life-course epidemiology, database management, and the application of cutting-edge causal inference methods, along with machine learning, to answer the socially and/or clinically important research questions. We hope this session will help SER participants to better understand the epidemiological studies for age-related diseases and natural disasters in Japan from clinical and social perspectives and will boost future opportunities for international collaborative work.

Guidance for Master's-Level Epidemiologists Considering Returning to School to Pursue Doctoral Studies

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Salon B-D

Lunchtime

SER has a genuine commitment towards supporting and promoting their master's-level professional membership. Sponsored by the SER Membership & Nominations Committee, 2023 will be the fifth year we offer the Master's-Level Symposia as we continue to promote and expand membership of this growing group of scientists.

This session is dedicated to supporting SER master's-level students and professionals contemplating returning to school to pursue doctoral studies. In the SER Master's-Level Survey of 2017, 24.4% planned to return to school to pursue doctoral studies (DrPH/PhD/ScD). In a traditional panel format, master's-level and doctoral-level epidemiologists working in a variety of settings will answer questions from master's-level attendees considering returning to school to pursue doctoral degrees (DrPH/PhD/ScD). For this panel, we have recruited seven individuals to serve as panelists. We have recruited panelists that are currently enrolled in doctoral programs (Patrick Arena, Sarah Cox, Hilary Colbeth, Sachelly Julián-Serrano, and Bianca Rivera) and have completed their doctoral studies (Dr. Talha Ali, PhD, and Dr. Ashley Buchanan, DrPH).

The overall objective of these two sessions is to highlight the valuable contribution of master's-level students and professionals in epidemiologic research, foster their professional growth inside and outside of SER, and demonstrate SER's devotion to this esteemed portion of the membership. Diversity Statement: The proposed panelists have been selected from SER Member Master List, with considerations for self-reported gender and race/ethnicity. Thoughtful considerations were made to select individuals that were at varying career levels (currently enrolled in full-time doctoral programs (PhD/ScD, n=4) or part-time doctoral program (DrPH, n=1) and individuals with doctoral degrees (PhD/DrPH, n=2).

The Role of SER in Furthering versus Addressing Epistemicide of Global South Epidemiologists

🕒 12:15 PM - 1:15 PM, Jun 15

📍 Columbia

Lunchtime

SER is currently implementing many actions through its executive and D&I committees to maintain its commitment to engaging scientists from historically underrepresented backgrounds and origins. These efforts have expanded from administering D&I surveys to choosing cities closer to the United States southern border to encourage the participation of Latin-American scientists in annual meetings, offering professional development series, mentoring graduate students from underrepresented groups, and reaching out to new institutions with the SER-Visits program. As these efforts ramp up, it is the perfect time to examine how SER promotes equity, diversity, and inclusion. In providing spaces for everyone to have a voice, global northern scientists need to foster cognitive and social justice and avoid falling into epistemicide (i.e., actions that silence, annihilate, or devalue knowledge systems) of global south researchers. Knowledge production cannot be called truly global until ideas and methods developed outside higher-income countries are universally accepted. Debates and disagreements will arise with this perspective, but these debates will ultimately broaden and enrich academic discussions addressing the pressing needs of the global south. The overall objective of this symposium is to bring experts from other disciplines who have denounced epistemicide of the global south epidemiologists' ideologies and advocate for equitable acceptance of methods and theories.

📍 Salon F

Symposia

As the pace of epidemiologic research seems to be accelerating and new analytic techniques become available and accessible rapidly, we propose pausing to read and reread some “classic” epi papers to ground ongoing developments in epidemiologic theory and methods. In this symposium, we pair junior and senior epidemiologists to discuss their reflections on four (4) papers from the epidemiologic literature, specifically, how each paper has influence the field since its publication and what lessons it might contain for us for the future. The papers are:

- 1) Hill AB. Environment and disease: association or causation? *Proc R Soc Med*, 1965; 58: 295–300.
- 2) Rose G. Sick individuals and sick populations. *Int J Epidemiol*, 1985; 14:32–38.
- 3) Hernán MA, Hernández-Díaz S, Robins JM. A structural approach to selection bias. *Epidemiology*, 2004; 15: 615–625.
- 4) Greenland S. Randomization, statistics, and causal inference. *Epidemiology*, 1990; 1: 421-9.

Chair(s): Matthew Fox

Epidemiology at the south of the border: a Latin American perspective of disparities and equity

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Columbia

Symposia

Latin America is a region characterized by a diverse population and deep levels of inequality that extend to all aspects of daily life including health. Political, social, and historical forces have fragmented the health systems resulting in inequities that impact indigenous, black, poor and other marginalized populations. While the upper socioeconomic classes, often those of lighter skin and European ancestry, can access high quality health services, people in lower socioeconomic strata are often left without basic care.

This symposium will cover research projects from Mexico to Chile that highlight health disparities in the region. Panelists will present examples of research that utilizes different methodological approaches to examine disparities impacting different populations. Topics will include an intersectional analysis of disparities in cervical cancer screening in Ecuador, an examination of spatial pattern of excess mortality during the COVID-19 pandemic in Guatemalan cities, complementary feeding practices among Mexican children, sociodemographic disparities in social and health trajectories of Chilean patients in substance use treatments, and psychosocial factors influencing the mental health status of Guatemalan healthcare workers during the COVID-19 pandemic. Following presentations, there will be time for broader questions and discussion.

Chair(s): Gabriela Bustamante

David Lopez

Presenters:

- Kevin Martinez Folgar- Discussant - spatial pattern of excess mortality during the COVID-19 pandemic in Guatemalan cities
- Alejandra Paniagua-Avila- Discussant - psychosocial factors influencing the mental health status of Guatemalan healthcare workers during the COVID-19 pandemic

Seeing the world through COVID-colored glasses: Epidemiology lessons learned during the COVID-19 pandemic

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Salon I

Symposia

Throughout the COVID-19 pandemic we have seen core concepts of epidemiology play out in real-time; these concepts were no longer just lessons from epidemiology textbooks, but issues that impacted our daily lives. Epidemiologists were suddenly called up to the front lines to explain these concepts to the lay public. The simultaneous timing of the pandemic and tragic events in the United States also brought discussions of social epidemiology, health disparities, and racism to the forefront. This symposium will begin with a brief presentation giving an overview of the many concepts of epidemiology that have been demonstrated in real life during the pandemic. We will then feature presentations from a diverse group of researchers with expertise on four topics that were particularly important during the pandemic: 1) predictive modeling, 2) disease surveillance, 3) health disparities and spatial inequities, and 4) public health policymaking. In addition to the well-known epidemiologists that made tremendous contributions during the pandemic, many trainees did terrific work focused on COVID-19. In this symposium we will feature the work of several graduate students on COVID-19 using a “three minute thesis” format to describe and communicate the significance of their work in a 3-minute presentation. Finally, we will end featuring a panel discussion on the concept of the COVID “infodemic” and how misinformation complicated the public health response to the pandemic.

Chair(s): Hailey Banack

Integrating Social Needs into Healthcare Systems: Oregon's Experience

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Meadowlark-Douglas

Symposia

Ten years ago, Sandro Galea wrote 'An Argument for a Consequentialist Epidemiology,' calling for epidemiology to shift its focus from etiology towards solving the problems that limit population health. One opportunity to engage in consequentialist epidemiology is through partnership with the healthcare system. In 2012, Oregon established a network of coordinated care organizations (CCOs) to administer the state's Medicaid program with the overarching goals of improving population health and quality of care while containing costs. Over time, the Oregon Health Authority has increasingly pushed the CCOs to address social determinants of health and health equity, which has prompted health systems to grapple with the challenges of integrating social and medical care. This symposium will share perspectives from five panelists on the front lines of the struggle to embrace population health science in primary care, behavioral health, and at the health systems level in order to go beyond documentation of health disparities and drive the structural changes necessary to reduce health inequities. We will contextualize Oregon's experience in the broader movement towards integrating social care in healthcare and offer suggestions for how the epi research community can engage with health systems to embrace an epidemiology of consequence.

Statistics in Epidemiology

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Mt Hood

Symposia

Statisticians have had an outsized effect on the field of epidemiology. This is so, in large part, because the study of health and disease involves sampling populations, or assigning treatments, and is therefore inherently subject to chance. Statisticians like Greenberg, Breslow, Cox, Rosner, Zeger, and their work are part of a lingua franca of the diverse subfields that comprise epidemiology. New developments in statistics point towards better study designs that allow epidemiologists to answer questions previously unanswerable, and promise better use of evidence, resulting in less bias and more precision. Translating new statistical methods into wide epidemiologic practice requires deep interactions between the fields of epidemiology and statistics. The present symposium provides an opportunity for such cross-field interaction with three leading voices from statistics who have made valuable contributions to the field of epidemiology.

Chair(s): Stephen Cole

Other is not a race

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Salon B-D

Symposia

Epidemiologists and other public health researchers increasingly include data on race in their studies, but fail to present information on how those race data were collected or how they are operationalizing race in their analyses. The most common treatment of race in epidemiologic studies is a three category “Black, White, Other.” Minority race groups that are often underrepresented in research studies are lumped together under the ambiguous label of “Other,” which is not informative of either the phenotypic or social construct of race. Study results for the “Other” category end up uninterpretable, misleading, or dropped from the analysis altogether. Some of the same problems arise in large heterogeneous race categories like “Asian” where distinct populations are lumped together, masking potential disparities. This symposium focuses on considerations for researchers who want to disaggregate race in their studies. We will include a discussion of: 1) how lack of data on some minority populations impacts evaluating health disparities, 2) the importance of reporting on distinct populations within categories of heterogeneous race groups when reporting study results, and 3) what we can do analytically when we have small sample sizes for minority race groups. This session will foster dialogue across topic areas and will therefore be of broad interest to SER members seeking to more thoughtfully incorporate the concept of race in their research.

Transforming education in a constantly evolving field: A multi-school perspective on how epidemiological curricula evolve and diversify over time in North America

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Salon E

Symposia

Epidemiology is taught in dozens of graduate schools in North America and globally but the context in which such training takes place can vary greatly according to several factors: i) is graduate-level epidemiology taught in a school of public health, a medical school, a veterinary school or elsewhere? ii) what is the balance between required substantive (e.g. cardiovascular epi, social epi...) and methods courses iii) How much analysis versus design courses? iv) How much fieldwork and data collection versus class-projects and coding? v) How much causal versus traditional methods in the curriculum?

Furthermore, epidemiology is a constantly evolving field and curricula need to constantly adapt to integrate contemporary public health topics such as structural racism, the COVID-19 pandemic or climate change as well as integrating modern developments in causal inference methods, electronic health record, omics data or machine learning techniques. Such transitions may happen flawlessly or with some resistance and discussing challenges and opportunities regarding such transitions may help identifying some generalizable mechanisms to facilitate such transitions in other contexts.

The main goal of this symposium is to illustrate the diversity of epidemiological curriculums and provide tools on how curriculums can change over time to inspire participants to engage in transitions or reinforce some training components in their own institutions.

Chair(s): Jessie Edwards and Tarik Benmarhnia

Abortion Access in the United States post Roe: public health implications and research gaps

🕒 1:45 PM - 3:15 PM, Jun 15

📍 Salon G-H

Symposia

With the Supreme Court's overturning of *Roe v. Wade*, abortion has been banned or soon will be in over half of US states. While abortion is a critical component of reproductive health care, it has long been siloed away from the field of epidemiology out of concerns about the political nature of the topic. This symposium will provide attendees with an overview of the current state of abortion access in the United States, discuss the robust clinical, public health, and epidemiologic evidence on the impact of abortion restrictions on individual health and wellbeing, and equip epidemiologists with the tools to be conversant in the basic epidemiology of abortion, the safety and effectiveness of abortion, and the public health and equity implications of restricting access to abortion. The symposium will be structured as a panel with a series of speaker presentations, followed by a moderated discussion and open question and answer session.

Panelists will provide an overview of the *Dobbs v. Jackson Women's Health Organization* opinion and its immediate impact on abortion access at the state level; situate the current state of abortion access within the historical context of reproductive oppression in the United States; highlight the evidence to date on abortion access issues both in the United States and globally; discuss methodological challenges in abortion estimation; and identify research needs and gaps in light of the current context of abortion in the United States

Politics and power: how structural racism shapes health inequities

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Salon B-D

Symposia

How do politics, political structures, and power create the foundations of structural racism in the United States and how do these factors produce racial health inequities?

Mainstream epidemiology and even much of social epidemiology has historically shied away from examining politics and power. And yet the inequities revealed by the COVID-19 pandemic, recent supreme court decision overriding Roe v. Wade, state threats to voting rights, and racial justice movements that seek to dismantle these forms of oppression illuminate the fundamental importance of politics, political factors, and power in determining who has access to health and health determinants.

Studying abortion in the post-Roe US: methods, challenges, and innovations

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Salon G-H

Symposia

This symposium responds to the recent changes in access to abortion and abortion rights in the US. Studying abortion and health has long been challenging because abortion is stigmatized and underreported. Epidemiologic challenges will increase as individuals frequently self-administer abortion drugs or are required to travel far distances to a clinic. To continue answering pressing questions, abortion researchers have been developing a wide range of creative approaches. In this symposium, we will explicitly discuss novel methods (i.e., methods other than recruiting at abortion clinics) to study abortion and health.

Specifically, each speaker will discuss their recent research findings as well as detailing the strengths and weaknesses of a specific method they use. Panelists use a broad range of methods, including collaborating with and analyzing data collected by an abortion fund in the Southeast US; recruiting abortion seekers using Google ads; using machine learning to utilize data from Google searches and Reddit posts; and using policy analysis to connect state-level abortion policy to infant and maternal mortality.

This symposium is very timely and will be of interest to epidemiologists studying abortion; those studying other stigmatized topics in health; and those interested in learning more about abortion and health.

Chair(s): Susanna Mitro

Presenters:

- Maeve Wallace- Population health consequences of constrained choice: state abortion restriction policies in association with maternal and infant mortality

Is epidemiology a statistical technocracy?: Resisting reduction in public health research.

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Salon I

Symposia

Audrey Lorde asks: "What does it mean when the tools of a racist patriarchy are used to examine the fruits of that same patriarchy? It means that only the most narrow parameters of change are possible and allowable." The rise of statistical thinking is stained with the legacy of eugenics and other essentializing theories of human difference. While epidemiology is a pluralistic discipline, the dominant paradigms in statistics and causal inference increasingly structure epidemiologic thought and practice. This symposium marks a space for disciplinary introspection. In Part 1, we locate a history of estimands designed by methodologists, not for their faithfulness to real-world public health problems, but precisely for their desirable statistical properties. We emphasize recent developments for the study of mechanism and mediation. In Part 2, we critically examine the impact of these trends by deconstructing contemporary investigations of racial difference and health equity in epidemiology. As case studies, we examine recent proposals for studying health disparities and present counterexamples to illustrate their limitations. In Part 3, we present innovative proposals that overcome some of these limitations. Proposals will be framed not as solutions but as invitations for imagining new methodologies that better capture the complexities in social and critical theories for public health. The symposium will close with 15 minutes of Community Discussion.

Emerging approaches to address systematic errors in epidemiologic studies

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Salon E

Symposia

Systematic errors—including selection bias, information bias, and uncontrolled confounding—are widely recognized threats to validity in epidemiologic studies. These biases are often listed as a potential limitation in the discussion section of manuscripts; however, quantitative bias analysis includes a robust set of tools to account for bias in epidemiologic analyses. New design and analytic approaches are being developed in epidemiology that account for systematic errors quantitatively, often by combining epidemiologic data with validation or external data source. Examples of these approaches include leveraging external data to account for misclassification or uncontrolled confounding, missing data imputation methods to address measurement error, and validation substudy design to account for time trends in classification parameters. In this session, our goal is to discuss recent advancements in quantitative bias analysis and provide a framework to how researchers may want to account for systematic errors in their study’s design and analysis. We propose a session with four invited speakers and a discussant who will unify the presentations with a panel discussion and a question and answer session

Preliminary Impacts of Oregon’s Drug Possession Decriminalization and Community Reinvestment Law (Measure 110)

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Meadowlark-Douglas

Symposia

The “War on Drugs” is a key driver of health inequities and racial disparities in the United States. Its negative impacts, including police violence, incarceration, and the collateral consequences of arrest and conviction, fall disproportionately on people of color and members of other marginalized groups. They span individual-, family-, community-, and societal-levels and reverberate across generations.

Decriminalizing drug possession and re-directing public funds toward drug treatment and recovery has the potential to reduce these negative impacts. Oregon recently became the first state to adopt a more health and equity-focused approach to drug-related harm by decriminalizing low-level drug possession and redirecting funds towards evidence-based approaches to drug use. A ballot initiative, Measure 110 (M110), re-classified possession of small amounts of drugs to a violation and larger amounts from a felony to a misdemeanor. Tens of millions of dollars were directed to care and treatment for people who use drugs, although funds are still being rolled out.

This symposium will discuss state-level surveillance approaches and share early findings of an evaluation of the impact of M110 on arrests and overdose using interrupted time series with comparison group. Our evaluation approach was driven by formative research with people who use drugs in Oregon, who identified metrics of importance and provided advice on how to structure the research project.

Answering questions by combining data sources

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Mt Hood

Symposia

A single data sources may be unable to adequately address pressing public health questions. Rather than accept these constraints, epidemiologists have taken steps to integrate information across multiple sources of information. Historically, two-stage studies, validation studies to correct for measurement error, mathematical modeling, and meta-analysis have all relied on combining or ‘fusing’ data across various sources. More recently, some of these approaches have been sharpened through the lens of causal inference. We build on the discussion prompted by last year’s “The New Epidemiology of Fusion Designs” by expanding the exchange to additional areas of epidemiologic methods research. To provide a clear synthesis of recent developments in the integration of information across sources, we have assembled a diverse panel of methodological experts to discuss the breadth of approaches to integrate information from varied sources; including meta-analysis, Bayesian analyses, and mathematical modeling. Speakers will showcase how these approaches can improve our ability to learn from data from both theoretical and practical perspectives. Attendees of the proposed session will gain exposure to a variety of modern tools at the forefront of methodological developments to combine data across sources and corresponding use cases in several substantive areas.

Spatial Epidemiologic Methods for Health Disparities Research

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Columbia

Symposia

Spatial epidemiology is the study of the spatial distribution and spatial determinants of health and well-being in human populations. Despite the increasingly recognized salience of neighborhoods on health outcomes and health behaviors, less spatial epidemiology work has been conducted on minoritized and marginalized populations. As physical and social environments give rise to health disparities, the increasing availability of high-resolution geospatial data (e.g. satellite-based data), emerging environmental exposures (e.g. wildfires), and contextual administrative data (e.g. land use mix) provides significant opportunities for spatial epidemiologic research to examine health disparities and promote health equity. Specifically, spatial epidemiology can map historic and ongoing processes to reveal sociopolitical and environmental causes of observed health disparities. Identifying these causes allows us to model impacts of policies, structural racism, and changing climate that address social inequities and remove harmful environmental exposures on health disparities. The objective of this symposium is to present and discuss cutting-edge spatial epidemiologic methods for examining health disparities with applications in diverse populations such as sexual minority men, historically marginalized communities, and resource limited settings (among others).

Specifying and emulating target trials to estimate causal effects of complex exposures

🕒 10:15 AM - 11:45 AM, Jun 16

📍 Salon F

Symposia

Target trial (TT) emulation is an increasingly utilized approach to estimate causal effects from observational data. Investigators outline key components of the hypothetical trial (the target trial) they would like to conduct and then attempt to emulate each component using observational data. TT emulation helps avoid common pitfalls of observational data analysis while generating results that are potentially more generalizable.

The TT framework is frequently used to study the effects of pharmacologic interventions (e.g. medications, vaccines) for which the intervention and key elements of time zero are sufficiently well-defined, and most pedagogical examples of the TT framework are taken from pharmacoepidemiology. However, TT emulation is and should be used in other areas of epidemiologic research, even though specifying a TT and emulating its components may be more challenging.

The objectives of this symposium are to discuss the role of TT emulation to evaluate causal effects of complex exposures for which the intervention or elements of time zero may not be sufficiently well-defined and to provide practical tools to conduct TT emulation in these settings. Speakers will present examples of TT emulations in environmental, social, and nutritional epidemiology and health policy. The discussant will highlight advantages and challenges of using TT emulation to estimate causal effects of complex exposures. The symposium will conclude with a Q&A panel with all speakers.

Writing a Compelling Individual Diversity, Equity, and Inclusion (DEI) Statement

🕒 12:00 PM - 1:00 PM, Jun 16

📍 Salon F

Professional Develop...

Diversity, equity, and inclusion (DEI) statements are increasingly being required for academic job applications (faculty and postdoctoral positions), promotion packets, and academic conference submissions. Hiring and reviewing committees' expectations for DEI statements are often opaque, and there is generally no formal training on how to write a strong DEI statement, leaving many of us questioning how best to write a compelling statement. Across career stages, even early career stages, we all have DEI experiences to highlight, and the purpose of this session is to review best practices for what is appropriate to include in a DEI statement and discuss various ways of approaching DEI statements across career stages. From the vantage point of reviewing DEI statements, we will also discuss controversies about how these statements should inform the evaluation of job applicants and promotion decisions.

Where the Epidemiologists Are

🕒 12:00 PM - 1:00 PM, Jun 16

📍 Salon E

Professional Develop...

Academic epidemiologists are strongly represented at the Society for Epidemiologic Research (SER) conference, but epidemiologists are found everywhere. This symposium aims to describe the role of the epidemiologist in various non-academic spaces, highlighting opportunities for students and early career epidemiologists across a range of areas. The audience will gain an understanding of the diversity of positions available in research for epidemiologists beyond those available in academia. Speakers from government, private research firms, non-profit, and the pharmaceutical industry will present on their experiences and transitions along their career development.

Developing and sustaining your research and professional agenda

🕒 12:00 PM - 1:00 PM, Jun 16

📍 Salon B-D

Professional Develop...

Epidemiologists are well-trained in the knowledge and skills of the profession yet have few formal opportunities to learn the strategic planning and time management skills that will most influence their career advancement. Apart from the usual milestones associated with epidemiologic training and career promotion, the trajectory of one's career is largely self-directed. Identifying professional goals at all stages of your career and developing concrete plans on how to achieve them can be daunting.

This dynamic session is designed to provide attendees with the tools to develop a personal strategy for successfully navigating their scientific, professional, and personal goals. This session's objectives are to provide initial training in three areas, and resources for self-learning after the session concludes. The three areas will be: (a) developing your research agenda, (b) finding the right fit and (c) planning and time management. For each, we will explain the importance of the skill for career advancement and provide content to initiate learning about the skill. Each segment will conclude with a Q&A and opportunity for engagement with scholars across the career trajectory (doctoral trainees to mid-career scientists).

An overview of Difference-in-Difference and Synthetic Control Methods: Classical and Novel Approaches

🕒 8:00 AM - 8:00 AM, Jun 17

Workshop (Virtual) Post-Co...

WORKSHOP DATE: July 7, 10:00am - 2:00pm Mountain Time

The interest in and use of quasi-experimental methods to evaluate the effect of a health policy or event on a health outcome has drastically increased in the epidemiological literature. Difference-in-differences (DID) and synthetic control (SC) designs exploit the specific timing and place of an intervention implementation as a natural experiment. Canonical versions of such designs have been typically used in settings including one policy/treatment of interest relying on several identification assumptions. In the past few years, recently developed designs based on staggered DID and SC have been proposed to relax several assumptions and handle multiple time periods and exposed units. Furthermore, many flexible extensions of the SC methods have been proposed such as the generalized synthetic control.

In this workshop, we propose an overview of DID and SC methods including the recent developments covering the historical context, the identification assumptions under the potential outcomes framework, and the different steps to implement such methods using various case studies. This workshop will introduce the theory and practice on the what, why, and how to implement canonical and staggered DID and SC methods (including the generalized synthetic control) in R/Rstudio. Attendees will work individually on hands-on programming exercises.

Causal inference and competing events

🕒 8:00 AM - 8:00 AM, Jun 17

Workshop (Virtual) Post-Co...

WORKSHOP DATE: July 6, 10:00am - 2:00pm Mountain Time

A competing risk event is any event that ensures the outcome of interest cannot subsequently occur. For example, in a study where prostate cancer death is the primary outcome, a fatal stroke is a competing event because an individual cannot die of cancer once they have died of stroke. When competing events are present, many possible definitions of a causal effect may be considered. Choosing a causal effect of practical interest requires understanding the interpretation of different counterfactual contrasts and the assumptions needed to identify them using the study data and subject matter knowledge. This workshop will introduce participants to a counterfactual framework for causal inference in the face of competing events. Participants will learn how to articulate and interpret different types of causal effects when competing events are present, and approaches to estimating them under transparent assumptions with the aid of causal diagrams. In part I, we cover counterfactual contrasts of popular parameters from the competing risks literature, including contrasts of cause-specific and subdistribution hazards, and cause-specific cumulative incidences and their relation to total and controlled direct effects from the mediation literature. In part II, we introduce the separable effects, new causal effect definitions that may be of particular clinical relevance in competing events settings. Theoretical concepts will be illustrated via practical examples and R code provided.

What would it take to change your inference? Quantifying the Discourse about Causal Inferences in Epidemiology

🕒 8:00 AM - 8:00 AM, Jun 17

Workshop (Virtual) Post-Co...

WORKSHOP DATE: July 18, 10:00am - 2:00pm Mountain Time

Causal inferences are often challenged because of uncontrolled bias. There may be bias due to uncontrolled confounding variables or non-random selection into a sample. We will turn concerns about potential bias into questions about how much bias there must be to invalidate an inference. For example, challenges such as 'But the inference of an exposure might not be valid because of pre-existing differences between the treatment groups' are transformed to questions such as 'How much bias must there have been due to uncontrolled pre-existing differences to make the inference invalid?' By reframing challenges about bias in terms of specific quantities, this workshop will contribute to scientific discourse about uncertainty of causal inferences. Critically, the approaches presented in this workshop based on correlations of omitted variables and the replacement of cases have strong intuitive appeal. In part I, we use Rubin's causal model to interpret how much bias there must be to invalidate an inference in terms of replacing observed cases with counterfactual cases or cases from an unsampled population. This is extended to logistic regression. In part II, we quantify the robustness of inferences in terms of correlations associated with unobserved variables. Calculations will be presented using the open-source app <http://konfound-it.com> with links to R and Stata modules. The format will be a mixture of presentation and individual hands-on exploration as well as group work.
